

TMR7303-D/P1

Unibody, Miniture Current Sensor

RoHS  CE

Description

TMR7303-D/P1 is based on tunnel magnetoresistance (TMR) technology with high signal-to-noise ratio (SNR) and high sensitivity for measuring DC, AC, pulsed current and arbitrary waveform current with galvanic isolation and its internal temperature compensation circuitry provides excellent performance under different ambient temperature ranges. It is also a open loop current sensor with low power, miniature size, excellent frequency response.

Features and Benefits

- Tunneling magnetoresistance (TMR) technology
- Fast response time, high bandwidth (≥ 500 kHz)
- Low noise, low power consumption
- Excellent temperature stability
- RoHS & REACH Compliant, UL Certified

Applications

- Photovoltaic inverter
- Switching power supplies
- Inverter and variable frequency drives (VFD)
- DC motor drive
- Power supplies for welding application

10. Frequency Response Characteristic

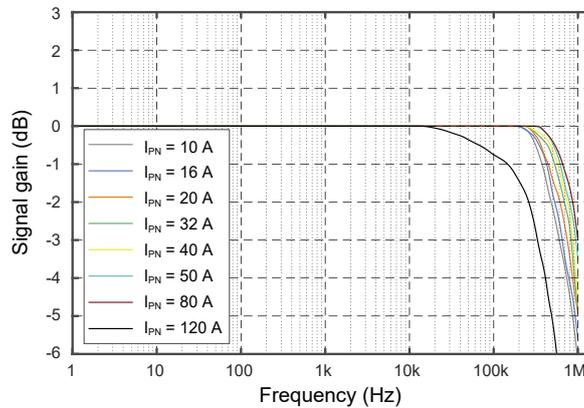

Figure 5. Bode plot

Step Response Time: The Voltage Output signal of current sensor is presented by the yellow CH1 and the pink CH3 is the reference step response input signal. The response time is the time difference between The time interval between primary when the applied step current reaches 90% of its final value, and secondary when the sensor Voltage Output reaches 90% of its output corresponding to the applied current which is approximately 0.4 μ s.

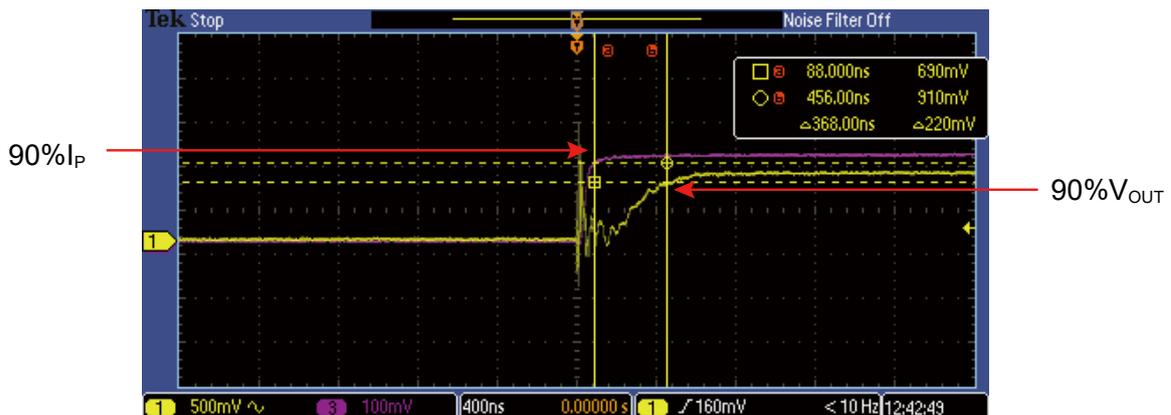

Figure 6. Step signal response time

The Time Delay between primary and the secondary Voltage Output and primary under a pure 500 kHz sine wave injected into the current sensor primary side is approximately 0.3 μ s.

11. Parameters Definition and Formula

1) Accuracy

$$X_G = \text{MAX}_{I_p \in [-I_{PN}, I_{PN}]} \left(\frac{V_{OUT} - (I_p \times S + V_{REF})}{I_{PN} \times S} \times 100\% \right)$$

I_p stands for primary current, I_{PN} stands for nominal primary current, V_{OUT} stands for current sensor output voltage at given primary current, S stands for sensitivity, V_{REF} stands for reference voltage output.

2) Sensitivity

$$S = \frac{V_{OUT(@I_{PN})} - V_{OUT(@-I_{PN})}}{2 \times I_{PN}}$$

$V_{OUT(@I_{PN})}$ and $V_{OUT(@-I_{PN})}$ stand for the voltage output at I_{PN} , $-I_{PN}$ respectively.

3) Linearity

$$\epsilon_L = \text{MAX}_{I_p \in [-I_{PN}, I_{PN}]} \left(\frac{|V_{OUT} - (I_p \times \bar{S} + \bar{V}_{REF})|}{I_{PN} \times \bar{S}} \times 100\% \right)$$

\bar{S} , \bar{V}_{REF} stand for the average values of the sensitivity and reference voltage output.

4) Offset Error

$$V_{OE} = V_{OUT(@I_p=0)} - V_{REF}$$

5) Hysteresis

$$V_{OH} = \text{MAX } \Delta H$$

ΔH is the maximum residual voltage between full scale positive and negative nominal current.

13. Pin Configuration and Wiring Diagram

Pin Number	Name	Function
1	V_{REF}	Reference voltage output
2	V_{OUT}	Voltage output
3	GND	Ground
4	V_{CC}	Power supply
5 ~ 7	I_{P-}	Primary current (reverse)
8 ~ 10	I_{P+}	Primary current (forward)

15. Remarks

1. Wave Soldering Profile: Maximum Temperature 260 °C for 10 s.
2. V_{OUT} is positive when the primary current (IP) is in the same direction as the arrow indication on the label and vice versa.
3. Improper connection may result in permanent damage of the sensor.
4. Bandwidth can be adjusted by adding low pass filter (LPF) between V_{OUT} and GND.
5. The current sensor must be disconnected from the power supply during installation. No other devices are allowed in the projection area under the sensor.
6. Sensor is customizable upon request.
